Abstracts

The global Pressure Vessels market was valued at 1062.46 Million USD in 2021 and will grow with a CAGR of .1% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Pressure Vessels is a closed container designed to hold gases or liquids at a pressure substantially different from the ambient pressure. The pressure differential is dangerous, and fatal accidents have occurred in the history of pressure vessel development and operation. Consequently, pressure vessel design, manufacture, and operation are regulated by engineering authorities backed by legislation. For these reasons, the definition of a pressure vessel varies from country to country, but involves parameters such as maximum safe operating pressure and temperature, and are engineered with a safety factor, corrosion allowance, minimum design temperature (for brittle fracture), and involve nondestructive testing, such as ultrasonic testing, radiography, and pressure tests, usually involving water, also known as a hydro-test, but could be pneumatically tested involving air or another gas. In consumption market, North America are the mainly consumption regions due to the demand of downstream applications. In 2017, it occupied 32.8% of the global consumption volume in total. Pressure vessels could be applied in many fields, such as petrochemical, oil & gas, coal chemical, nuclear power, non-ferrous metal and others. With the development of economy, the downstream application industries will need more pressure vessels. So,

pressure vessel has a huge market potential in the future. Manufacturers engaged in the industry are trying to produce good performance pressure vessels through improving manufacturing process. The major raw materials of pressure vessels are steel, copper, aluminum, etc. Fluctuations in the price of the upstream product will impact on the production cost of pressure vessels, and then impact the price of pressure vessels.
