A Probe Station is used to physically acquire signals from the internal nodes of a semiconductor device. The Probe Station utilizes manipulators which allow the precise positioning of thin needles on the surface of a semiconductor device. If the device is being electrically stimulated, the signal is acquired by the mechanical probe and is displayed on an oscilloscope or SMU. The global Probe Station market has been broadly segmented based on design, application, and region. According to the research study, the Auto Probe Station type segment held a significant share of the of the Probe Station market. Based on application, the Semiconductor segment accounted for significant market share in 2019. The Semiconductor segment is anticipated to continue to dominate the market during the forecast period.
