Prostate biopsy is a procedure in which small hollow needle-core samples are removed from a man`s prostate gland to be examined microscopically for the presence of cancer. Prostate biopsy samples can be collected in different ways. Your prostate biopsy may involve: 1. Passing the needle through the wall of the rectum (transrectal biopsy). This is the most common way of performing a prostate biopsy. 2. Inserting the needle through the area of skin between the anus and scrotum (transperineal biopsy). A small cut is made in the area of skin (perineum) between the anus and the scrotum. The biopsy needle is inserted through the cut and into the prostate to draw out a sample of tissue. An MRI or CT scan is generally used to guide this procedure.
