Radiopharmaceuticals are radioactive compounds administered to the patient, and monitored via specific imaging devices, for diagnosis and therapeutic purposes. It is composed of a radioisotope bond to an organic molecule. The organic molecule conveys the radioisotope to specific organs, tissues or cells. The radioisotope is selected for its properties. Radiopharmaceuticals are used in the field of nuclear medicine as radioactive tracers in medical imaging and in therapy for many diseases (for example, brachytherapy). Many radiopharmaceuticals use technetium-99m (Tc-99m) which has many useful properties as a gamma-emitting tracer nuclide. In the next few years, Radiopharmaceuticals industry will maintain increasing at a relatively high growth rate. Investors are still optimistic about this area; the future will still have more new investment enter the field. The classification of Radiopharmaceuticals includes Diagnostic Radioisotopes, Therapeutic Radioisotopes. The revenue proportion of Diagnostic Radioisotopes in 2016 is about 77%, and the proportion is in decreasing trend from 2012 to 2017. The Therapeutic Radioisotopes is enjoying more and more market share. Radiopharmaceuticals are widely used in Oncology, Cardiology and Other disease diagnosis and treatment. The most of radiopharmaceuticals is used in

Oncology, and the sales proportion in 2016 is about 60%.
