The global Recombinant Vaccines market was valued at 802.28 Million USD in 2021 and will grow with a CAGR of 3.36% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Recombinant vaccines are produced using recombinant DNA technology, with the help of a vector. These vaccines stimulate the immune system of an individual and provide immunity against various lethal disease. These vaccines are safe and have less or no side-effects as compared to conventional vaccines, in the prevention of various diseases such as influenza, cholera, typhoid, and dengue. Recombinant vaccines are also used in animals for prevention of diseases such as foot and mouth disease, pneumonia and septicemia, and pox disease. Vaccination results in the prevention of disease, by producing antibodies against the protein antigen of pathogenic microorganisms. There is increase in the demand for livestock products, which in turn has increased growth of the animal recombinant vaccine segment and Europe dominates the animal recombinant vaccines market as compared to other regions due to highly organized livestock and huge demand of livestock product for the European population.
