Recycled Glass is the discarded material which came into picture after the rising concern about product disposal. The product is generally mixed with glass manufacturing furnace with virgin raw materials, such as limestone, sand, soda ash to produce new glass products. Recycled Glass mainly has two destinations: recycling into glass containers and recycling into other products. When glass is used for new container manufacturing, it is virtually infinitely recyclable. The processing and use of recycled glass in manufacturing conserves raw materials, and reduces energy consumption. That which is not recycled, but crushed, reduces the volume of waste sent to landfills. The use of the recycled glass as aggregate in concrete has become popular in modern times. Common applications are as pipe bedding?placed around sewer, storm water or drinking water pipes to transfer weight from the surface and protect the pipe. Another common use would be as fill to bring the level of a concrete floor even with a foundation.
