The global Retinal Imaging Devices market was valued at 1018.25 Million USD in 2021 and will grow with a CAGR of 6.24% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact wwhich will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market verdors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Retinal Imaging Device provides simultaneous non-contact pole-to-periphery views of the retina in a single, patient-friendly capture. In this report include OCT and Fundus camera. Optical coherence tomography (OCT) is an imaging technique that uses low-coherence light to capture micrometer-resolution, two- and three-dimensional images from within optical scattering media (e.g., biological tissue). Ocular (or ophthalmic) OCT is used heavily by ophthalmologists and Optometrists to obtain high-resolution images of the retina and anterior segment. Fundus camera is a specialized low power microscope with an attached camera. Its optical design is based on the indirect ophthalmoscope. Fundus cameras are described by the angle of view - the optical angle of acceptance of the lens. North America is the largest consumption place, with a consumption market share nearly 31.7% in 2017. Following North America, Europe is the second largest consumption place with the consumption market share of 29% in 2017.
