Medical food is a category of products for dietary management or supportive therapy for specific disease or medical conditions such as pulmonary and metabolic disorders. Ingredients used in medical foods must have generally recognized as safe (GRAS) status, which is assigned to naturally found food materials. Medical food is different from nutritional food, dietary supplements, and prescription drugs. Medical food is protein-based, nutrient-based (Omega 3 fatty acids, chelated zinc, and isoflavones), and may contain minerals and vitamins such as folic acid and thiamine. These products are prescribed by physicians or taken under their supervision. Growing regulatory support, increasing awareness about medical food in emerging economies and advantages over drug therapies are expected to be the major factors driving growth of the global Rx medical food market over the forecast period.
