The ship plate is a hot rolled steel sheet produced to manufacture hull structures as required by the code of conduct. In the 1870s carbon was added to molten iron to make steel. Iron and steel were soon being used in ship production. These irons and steels were known as ABS (American Bureau of Shipping) iron and steel. They constitute specific types of iron and steel utilized to build ships. How they are manufactured and used is regulated by the ABS standardized grading and specification system. A critical factor for growth in Asia region is availability of raw materials at lower prices coupled with the presence of large number of suppliers and producers. China is anticipated to lead growth of the Asia Pacific market over the next six years. All manufactures in the world are committed to the improvement of product. These two years, some of Chinese manufactures can almost catch up with the world's leading technology too. Most technologies are developed by the manufacturers instead of importing from other companies. With the recovery of world shipbuilding industry and the increased proportion of output for high technology and high added - value ships, China will enter into the list of world powerful shipbuilding countries.
