Abstracts

The global Silage Additives market was valued at 13.14 Million USD in 2021 and will grow with a CAGR of 4.3% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

The goal of silage preservation is to reduce oxygen and increase acidity rapidly, so that lactic acid bacteria grow to stabilize and preserve the forage. Stimulants, such as bacterial inoculants, sugars, and enzymes, are intended to improve the growth of lactic acid bacteria and their acid production. Inhibitors, such as propionates, nonprotein nitrogen, and acids, should slow down unwanted silage degradation. The North American region accounted for the highest adoption of silage additives in the livestock industry in 2017, owing to the growth in awareness and increase in the production of corn silage in the US and Canada. Asia Pacific is projected to be the fastest-growing region for the silage additives market in agricultural applications from 2018 to 2023. The significant growth of exportable commodities from the dairy sector, in order to meet the export quality standards, strengthened the market potential for local silage additive manufacturers to develop various products based on organic acids, NPN nutrients, and sugars.
