A smart card, a type of chip card, is a plastic card embedded with a computer chip that stores and transacts data between users. This data is associated with either value or information or both and is stored and processed within the card's chip, either a memory or microprocessor. The card data is transacted via a reader that is part of a computing system. Smart card-enhanced systems are in use today throughout several key applications, including healthcare, banking, entertainment and transportation. To various degrees, all applications can benefit from the added features and security that smart cards provide. China's Smart Card industry is still in the development stage. China is a large population country, there are only few manufacturers which can produce the Smart Card product. Most of Smart Card products are still relying on import. With the People's Bank of China (PBOC) have announced all banking cards in China would migrate to smart cards, the demand for smart card have a rapid development in recent two years. At present, there is still a wide gap in the market size, the capital, marketing, product development or technical studies between China domestic enterprises and foreign enterprises, especially in some high-end technology field. In the coming years, Smart Card market is expected to witness the highest growth

rate in the Asia-Pacific region. Although Smart Card brings a lot of opportunities, the study group recommends the new entrants just having money but without technical advantage and upstream and downstream support do not to enter into this field.
