The global Smart Water Management market was valued at 186.21 Million USD in 2021 and will grow with a CAGR of 13.3% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

A smart meter is usually an electronic device that records consumption of electric energy in intervals of an hour or less and communicates that information at least daily back to the utility for monitoring and billing. Smart meters enable two-way communication between the meter and the central system. Unlike home energy monitors, smart meters can gather data for remote reporting. Such an advanced metering infrastructure differs from traditional automatic meter reading in that it enables two-way communications with the meter. With the development of network technology, especially the rise of the Internet of things technology, new technology related to the smart water meter (terminal) emerges in an endless stream, mainly including: wireless or wired network technology, network communication protocol and routing technology, network access technology, data security and reliability technology, data acquisition and management technology, automatic meter reading and selling water management system technology, etc.
