## Abstracts

The global STEAM METHANE REFORMING market was valued at 5.83 Million USD in 2021 and will grow with a CAGR of 5.77% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Steam Methane Reforming, or SMR, processes feedstocks, ranging from natural gas to light naphtha, mixed with steam to produce a hydrogen rich syngas effluent, with a typical H<sub>2</sub>/CO ratio of 3:1 to 5:1. SMR based plants are most commonly used to produce a hydrogen product or a combination of a hydrogen stream and another syngas product. In an SMR based plant, a heated mixture of the hydrocarbon feedstock and steam flows through catalyst filled tubes within a fired furnace called a reformer. The report covers large and medium SMR with hydrogen production capacity ranging ranging more than 1000 Nm<sup>3</sup> /hr. The global demand for refinery hydrogen has increased significantly over the past decade due to changes in available crude feedstocks and tighter environmental regulations, which have forced the refining industry to reduce sulphur, olefins and aromatics content in transportation fuels. This, coupled with the continued growth in diesel demand, means that refiners are investing heavily in both hydrotreating and hydrocracking facilities, and are constantly looking for access to low-cost, reliable sources of high-purity hydrogen. The global crude oil industry is dominated by large corporations, and these corporations are becoming larger through acquisitions, allowing themselves to offer a wider range of oil field services such

as exploration, drilling, design, and engineering. Lower oil prices have a side effect to this industry. If the profit of upstream crude oil manufacturers is reduced, the willingness of these manufacturers to retrofit and upgrade new ones will be reduced, which may reduce such large projects
