Abstracts

The global Surgical Robots for the Spine market was valued at 97.75 Million USD in 2021 and will grow with a CAGR of 18.97% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Spinal surgery has evolved dramatically over the years as advances in technology have made it possible to improve surgical techniques. Spinal surgery involves the modification of the affected area of the back bones and nerves. The implantation of one or more screws or components is a very delicate surgery. The robot can achieve better precision than can a skilled surgeon. Robotic procedures offer significant cost savings in terms of pre- and post-operation care costs and length of stay at hospitals.

Technological advances and breakthroughs leverage new materials and new sensor configurations. Sophisticated software is further evolving product implementation: Clinically efficient solutions, clinically less complex surgery, shorter length of stay, minimally invasive surgery, financially lower cost and operationally more simple. The spine surgery robot industry has a relatively concentrated industrial structure. Spinal surgery robots include: separation systems and combination systems. The independent system is the main product in recent years. North America is the region with the largest sales of spinal surgery robots. Europe is the second largest sales area for spinal surgery robots.
