System In a Package SIP (System In a Package) is the integration of a variety of functional chips, including processors, memory and other functional chips In a Package, so as to achieve a basic complete function. Corresponding to SOC (System On a Chip system-level Chip). The difference is that system-level packaging adopts the side-by-side or superimposed packaging mode of different chips, while SOC is a highly integrated chip product. SIP has been defined as the formation of a system or subsystem from a single standard package that preferentially assembles several active electronic components with different functions with optional passive devices and other devices such as MEMS or optical devices. From the perspective of encapsulation development, SIP is the foundation of SOC encapsulation implementation.
