Telecom Power Systems consist of DC power systems, AC power systems and grounding system. The essential parts of a system are rectifiers, distribution unit and a power system controller. In direct current (DC) power systems, a rectifier converts alternating current (AC) to DC and provides the power necessary to charge batteries. In AC power systems, an inverter converts DC into uninterruptible AC. A power system controller monitors and controls the entire system and site power infrastructure, maximizes battery life, supports energy and cost savings, and informs the operator of maintenance needs. The power system can be expanded with renewable energy sources, which creates major energy and operating cost savings. Telecom power systems is an important part of many telecom devices, which is used in the mobile telecom base stations, comprehensive access network site, data center. At currently, China is to accelerate the development of its high-speed broadband network and 4G LTE from 2015 and the major three communications operators also increase the investment of fixed assets of telecom industry. Many policies has released to stimulate the telecom industry, which will promote the demand for the telecom power systems.
