A telehandler, also called a telescopic handler, is a machine that is used to lift loads in agricultural, construction, environment, logistics, and mining and quarrying industries. Apart from lifting loads, this machine can be used for material handling, digging trenches, and elevating personnel and underground mine baskets. The stringent emission standards in major markets is one of the key growth factors for the telehandlers market for the construction industry. It has been observed, that the construction industry accounts for the substantial increase in the emission of air pollutants such as greenhouse gases. To curb the level of pollutants in the air, the governments of various countries are taking stringent efforts such as the implementation of Tier 4 norms for heavy industries. These initiatives strictly enforce the companies to adopt and leverage the use of new advanced equipment. Moreover, the Tier 5 regulations imposed by the government mandate the vendors to install a separate diesel particulate filter (DPF) for the engines to curtail further emission.
