A theodolite is an instrument for measuring both horizontal and vertical angles, as used in triangulation networks, and geo-location work. It is a tool used in the land surveying and engineering industry, but theodolites have been adapted for other specialized purposes as well. The horizontal accuracy of theodolites depends on 'seconds'. The 2-5' accuracy theodolite is above the middle level. A modern theodolite consists of a movable telescope mounted within two perpendicular axes—the horizontal or trunnion axis, and the vertical axis. When the telescope is pointed at a target object, the angle of each of these axes can be measured with great precision, typically to seconds of arc. As one of the most important professional instruments of surveying and mapping, theodolite plays a valuable role in survey and engineering, mapping and GIS, land administration and other industries. The large downstream demand drives theodolite industry developing.
