Thermal drying technology is based on removal of water from dewatered solids which accomplishes both volume and weight reduction. The added benefit of thermal drying is that it typically results in a product with significant nutrient value. Typically, dewatered solids (at approximately 18% to 35% dry solids content) are delivered to a thermal drying system, where most of the water is removed via evaporation resulting in a product containing approximately 90% solids. In the thermal drying system, the temperature of the wet solids mass is raised so that the water is driven off as a vapor. By removing most of the water from the solids, thermal drying results in a significant reduction in both volume and mass. The Thermal Drying Dewatering Equipment are mainly used by Pulp, Textile, Oil, Food and Beverage. The main applications of Thermal Drying Dewatering Equipment are Textile and Food and Beverage. Despite the presence of competition problems, due to the increasing demand of Thermal Drying Dewatering Equipment, investors are still optimistic about this area, investors are still optimistic about this area; the future will still have more new investment enter the field.
