The global Thermo Compression Bonder market was valued at 30.54 Million USD in 2021 and will grow with a CAGR of 22.73% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Thermo Compression Attach. Using this technique, there are no adhesives to join the die and the package. Instead, heat and force are applied to the die in a process called 'Thermo Compression Bonding'. The bumps are forced against their opposing pads and a second metallic bond is formed where the bond comes into contact with the package metallization. This technique typically requires the use of heat as high as 350? to 400?C, and forces of as much as 100 g/bump. Thermo Compression Bonding (TCB) is a chip attach technology under investigation and implementation in multiple platforms. The global Thermo Compression Bonder market is driven by increased Thermo Compression Bonder usage: memory applications currently, logic devices next. Meanwhile, Thermo Compression Bonder is gaining market share from wire bond assembly processes. Also, lower throughput coupled with higher processing costs was example of challenges in the TCB technology. China Thermo Compression Bonder market is valued at \$6.39 million in 2017 and is expected to reach \$19.53 million by the end of 2023, growing at a CAGR of 20.47% between 2018 and 2023.
