The global Transmission Electron Microscope market was valued at 602.04 Million USD in 2021 and will grow with a CAGR of 5.09% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Transmission electron microscopy (TEM) is an imaging technology in which electron beams pass through very thinly sectioned specimens. As the electrons are transmitted through the specimen and interact with its structure, an image resolves that is magnified and focused onto an imaging medium, such as photographic film or a fluorescent screen, or captured by a special CCD camera. Because the electrons used in transmission electron microscopy have a very small wavelength, TEMs can image at much higher resolutions than conventional optical microscopes that depend on light beams. Due to their higher resolving power, TEMs play an important role in the fields of virology, cancer research, the study of materials, and in microelectronics research and development. Transmission electron microscope market has been growing at a steady pace, owing to its growing demand in healthcare research. This microscope provides high magnifications and high resolution images, which are highly regarded in identifying various microorganisms and cell structure. They are also utilized for molecular and cellular biology. Additionally, growing demand in materials science has also been positively impacting the growth of the market. There is a growing demand for developing lighter and stronger metals, for utilization in body of vehicles, energy production and

machineries among others. Such demand has led to higher application of transmission electron microscopes, as it allows for higher visibility of structure and composition of the newly developed material. It also allows for viewing of any possible defects in the structure. Such applications have been promoting the growth of the market. However, these microscopes require the specimen to be thin enough for allowing electrons to pass through. Such specimen preparation difficulties have been hindering the growth of the market for transmission electron microscopes. Increasing application of transmission electron microscopes in semiconductor research and mining sectors are expected to offer good growth opportunities during the forecast period.
