A vaccine is a biological preparation that improves immunity to a particular disease. A vaccine typically contains an agent that resembles a disease-causing microorganism, and is often made from weakened or killed forms of the microbe, its toxins or one of its surface proteins. The agent stimulates the body's immune system to recognize the agent as foreign, destroy it, and 'remember' it, so that the immune system can more easily recognize and destroy any of these microorganisms that it later encounters. Travelers are at increased risk for several infections, including familiar infections such as measles that are widely distributed but more common in developing countries. Travelers Vaccines can markedly decrease the risk for many of these infections and are an important part of pretravel preparation. In this report, the travelers vaccines mainly covers vaccine for hepatitis A, hepatitis B, rabies, typhoid fever, yellow fever, Japanese encephalitis, meningococcal meningitis, cholera, etc. The classification of Travelers Vaccines includes Meningococcal Vaccine, Japanese Encephalitis Vaccine, Yellow Fever Vaccine, Hepatitis Vaccine, Cholera Vaccine and other vaccines. The proportion of Hepatitis Vaccine in 2016 is about 28.94%, the proportion of Japanese Encephalitis Vaccine in 2016 is about 15.67%, and the proportion of other

vaccine in 2016 is about 24.55%.
