Trimellitic anhydride (TMA) is an important refined chemical product with white or light yellow flake crystal structure. With a molecular formula of $C_9H_4O_5$, Trimellitic anhydride has a molecular weight of 192.12, a melting point of $165^{\circ}C$ and a boiling point of $390^{\circ}C$. Trimellitic anhydride can dissolve easily in water, ethyl alcohol and other organic solvents. In the presence of water, Trimellitic anhydride (TMA) will rapidly hydrolyze (within 10 minutes) to form Trimellitic Acid (TMLA). Trimellitic anhydride is widely used in production of PVC plasticizer, polyester resins, amino-alkyd resin, curing agents of epoxy resin, lubricant, adhesive and other important chemical products. In terms of product classification, Trimellitic Anhydride can be generally divided into MC method products and MGC method products. In 2019, MC method products accounted for the largest proportion of the total market share, about 95%. In terms of product application, Trimellitic Anhydride is generally used in trimellitic acid ester plasticizer, powder coating, insulating material, polyester resin and others. In 2019, trimellitic acid ester plasticizer accounts for the largest proportion of the total market share, about 50%.
