The global UV Absorbers market was valued at 690.94 Million USD in 2021 and will grow with a CAGR of 3.71% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

An ultraviolet absorber or UV absorber is a material that is used to dissipate ultraviolet light into a lower energy state. They are typically used to protect polymers by preventing the harmful ultraviolet light from degrading the polymer. Ultraviolet absorbers have many different material compositions, including: Benzotriazole is a common ultraviolet absorber for polyvinyl chloride (PVC). Cyanoacrylate is a common absorber for adhesives. Benzophenone is commonly used as an ultraviolet absorber for many different types of plastics. There is a difference between ultraviolet absorbers and hindered amine light stabilizers. Hindered amine light stabilizers 'hinder' the negative effects that ultraviolet light can have on a material, whereas ultraviolet absorbers actually absorb the ultraviolet light and release the energy in the form of heat.
