Ultraviolet (UV) ink technology is an ongoing trend in the printing industry. The basic difference between this method and other traditional methods is that the ink is cured through a photomechanical process rather than evaporating solvents into the air. The printers based on this technology offer cleaner environment, and negligible ozone emissions. HUV is a new UV printing method, wherein the ink is dried immediately on the surface of the paper using UV light. UV inks upon exposure to UV light from a liquid paste, or solid rapidly. Currently the niche printing method is more visually appealing than conventional style printing, and less damage to the environment.
