Abstracts

The global Vaccines Isothermal Boxes market was valued at 98.36 Million USD in 2021 and will grow with a CAGR of 7.27% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

All vaccines lose potency over time. As the rate of loss is temperature-dependent, the World Health Organization (WHO) recommends vaccine products be transported and stored between 2°C and 8°C. Maintaining this range from the point of manufacture to the point of administration requires a temperature-controlled supply chain or cold chain—a global distribution network of equipment and procedures for sustaining product quality (potency) during transport, storage, and delivery. Vaccines Isothermal Boxes is an innovative insulated packaging used for the transportation of Vaccine at controlled temperatures. It efficiently preserves the products from thermal and physical shocks, and most pathogens cannot survive at sub-zero temperatures. Field trials of large capacity insulated containers are underway. The vaccine storage capacity of these units is many times that of the largest current cold boxes. The units are either pallet-based or wheeled and they offer the possibility of simpler and more secure transport for large quantities of vaccine from primary to sub-national level. There is an increasing need for larger capacity products at this point in the supply chain now that vaccine volumes are increasing dramatically. If the trials are successful, WHO will develop a suitable PQS specification.
