The global Viscometers market was valued at 117.61 Million USD in 2021 and will grow with a CAGR of 3.92% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

A viscometer is an instrument used to measure the viscosity of a fluid. For liquids with viscosities which vary with flow conditions, an instrument called a rheometer is used. Viscometers only work under one flow condition. In general, either the fluid remains stationary and an object moves through it, or the object is stationary and the fluid moves to pass it. The drag caused by relative motion of the fluid and a surface is a measure of the viscosity. The flow conditions must have a sufficiently small value of Reynolds number for there to be laminar flow. Viscometer industry is mainly dependent on the company's research development and sales services, while manufacturing lies in relatively weak position. The reason for this is lack of a strong technological competitiveness, production processes focused on producing parts and assembly-based integration
