In order to produce heat-treated flour or heat-treat the flour directly, modified flour is often used to modify the properties of the resulting flour. We can broadly divide the types of heat treatment into two types, wet and dry. Wheat Heat Treatment enables food manufacturers to replace chemically modified ingredients in foods and mixtures, thereby satisfying consumers and improving people's product performance. Wheat heat treatment is more expensive than untreated flour, but they add an important safety factor to the product. Consumers today want to bring home with cleaner labels and more natural ingredients.
