Marble is a metamorphic rock that forms when limestone is subjected to the heat and pressure of metamorphism. It is composed primarily of the mineral calcite (CaCO₃) and usually contains other minerals such as: clay minerals, micas, quartz, pyrite, iron oxides and graphite. Under the conditions of metamorphism the calcite in the limestone recrystallizes to form a rock that is a mass of interlocking calcite crystals. The white marble market is relatively large, as the demand of white marble is increasing in the whole world. And the global output of white marble remained a relatively high growth during the last few years, especially in the Chinese market; the white marble market is up to a double-digit growth, mainly due to the fast development of construction industry. This industry is affected by the global economy and government policy, so it's important to keep an eye on economic indexes and leaders' preference. With the global economic recovery, more and more people pay attention to rising environment standards, especially in underdeveloped regions where there is large population and fast economic growth the demand of white marble will increase in future.
