The tower is an important element in the structure of a wind turbine. It transmits loads from the nacelle to the foundation and is a significant factor in determining profitability: the higher the tower, the higher the energy output. With the government's favorable policies and efforts to increase the share of clean and renewable energy in power generation, the Asia-Pacific region is expected to become a promising market for wind power towers in the next few years, which will reach over 55% market share by 2025 from 52% in 2018.
