Abstracts

Coronary arterial disease is one of the leading causes of death in Europe. Interventional cardiology is a minimally invasive technique that uses catheters to treat coronary arterial disease. The most common interventional cardiology procedure is percutaneous transluminal coronary angioplasty (PTCA), which is performed for the management of coronary atherosclerosis. There many different types of complementary devices used during interventional cardiology procedures. These devices include:

coronary stents,

PTCA balloon catheters,

interventional coronary catheters and guidewires,

coronary embolic protection devices,

coronary atherectomy devices,

coronary introducer sheaths,

coronary vascular closure devices,

diagnostic coronary catheters and guidewires,

fractional flow reserve (FFR) guidewires,

intravascular ultrasound (IVUS) catheters,

and optical coherence tomography (OCT) catheters.

Cardiovascular disease (CVD) is a common illness, afflicting one in every three individuals in Europe. The effects of CVD can vary from simple high-blood pressure to a fatal stroke. Interventional cardiology is primarily applied to the treatment of coronary heart disease (CHD), which is a specific cardiovascular illness. CHD encompasses myocardial infarction (MI) and angina pectoris, diseases that account for over half of all CVD cases.
