Abstracts

In 2010, there were nearly 138,000 new cases of various bone marrow-related diseases and cancers diagnosed in the United States.

Although bone marrow-related diseases may be detected by imaging or blood tests, bone marrow biopsies often provide the most definitive diagnosis. Advancements in diagnosis and early detection of these diseases are expected to decrease disease prevalence by 2017.

Scope: This report pertains to a forecast period of 10 years (2007 – 2017) for the U.S.
