Abstracts

Dental implants are artificial tooth roots that function to support a restoration put in place for a missing tooth or teeth and additionally aid in the prevention of jaw bone loss. They are typically offered in the form of a metal-based material, such as titanium, and are inserted into the jaw to replace missing teeth. They can be described based on their shape and method of attachment to the jaw. Ultimately, dental implants serve to support restorative products such as crowns, bridges and dentures.

Dental implant treatments consist of one-stage, two-stage and immediate loading procedures. Dental implants are available in a variety of forms including tapered or parallel wall shapes. In addition, they are offered with internal or external connections, or manufactured as a single unit.
