REPORT SYNOPSIS

Polyoxymethylene (POM) is commonly used as a direct replacement for metals due to its stiffness, dimensional stability and corrosion resistance and is widely used in the production of precision parts for applications including automotive, electrical & electronics, industrial and medical. POM resins are available in homopolymer and copolymer formats, with acetal copolymers offering high toughness over a wide range of temperatures, with greater resistance to hot water, hot air, and creep, as against homopolymers. However, homopolymers offer better mechanical and thermal properties.

Demand for polyoxymethylene (POM) worldwide was declined by 5.2% year-over-year in 2020 due to reduction in demand from automotive & transportation and industrial applications amid the impact of coronavirus pandemic. Global demand for polyoxymethylene (POM) recovered in 2021 and continued the momentum through 2022 there by registering a volume CAGR of 1.9% during 2019-2022 period attributed to firm demand from electronics, appliances and medical sectors and recovery in automobile production.
