Breast cancer is one of the major cause of mortality among women in both the developed and developing world. Early detection remains the primary defense available to patients in preventing the development of life-threatening breast cancer. Breast cancer screening is the regular examination of a woman's breasts to find breast cancer early. Screening for breast cancer primarily involves mammography. It is the best screening test for reducing the risk of dying from breast cancer. In addition to mammography, the screening method such as MRI and ultrasound may be used to help find breast cancer in young women with a high risk for developing breast cancer.

The global breast cancer screening market is anticipated to grow over the forecasting period. The major factors driving the market for breast cancer screening are growing incidence of breast cancer globally, increasing government initiatives and support, rising female geriatric population base, increasing awareness about early detection of breast cancer, and technological advancements. However, factors such as controversies related to mammography and socio-cultural barriers are expected to restrain the growth of this market in the coming years.

Breast Cancer Screening Market and Population Analysis: United States is the largest market for breast cancer screening. Germany and China are the second and third leading market for breast cancer screening and are competing closely with each other to grab maximum share of the pie.
