## Abstracts

The global 3D printing market size reached US\$ 19.8 Billion in 2022. Looking forward, IMARC Group expects the market to reach US\$ 67 Billion by 2028, exhibiting a growth rate (CAGR) of 21.4% during 2023-2028.

The 3D printing technology involves a layer-by-layer addition of materials to build patterns, physical models, tooling components and production parts using software and 3D printers. This technology assists in creating high-end 3D objects of any shape and size without the use of molds or machines. As the technology enables producers to build customized products, it is widely employed in industries such as consumer electronics, healthcare, automobiles, aerospace, etc. to provide solutions and services.

3D printing technology is utilized in the automotive industry to manufacture prototypes and various functional parts. It is also employed in the fashion industry to make jewelry and nylon-based clothing designs. Moreover, customized hearing aid shells, braces and tooth implants are produced using 3D printing in the healthcare sector. Nowadays, manufacturers are also investing in research and development activities for the production of prosthetic parts with the help of biological materials such as bone, skin and cartilage. Furthermore, the advent of metal 3D printing technologies like binder jetting has helped in reducing the overall production time and costs. This is anticipated to bolster the applications of 3D printing particularly in the aerospace industry for manufacturing lighter aircraft structures, frames and parts. North America and Europe being early adopters currently represent the largest market for 3D printing. The Asia Pacific region, particularly China, however, is expected to witness large scale adoption of 3-D printing in the manufacturing sector in the coming years.
