Abstracts

The 7 major acoustic neuroma markets are expected to exhibit a CAGR of 5.61% during 2024-2034.

The acoustic neuroma market has been comprehensively analyzed in IMARC's new report titled "Acoustic Neuroma Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Acoustic neuroma refers to a non-cancerous (benign) tumor that develops on the vestibular nerve, which is responsible for transmitting balance and sound information from the inner ear to the brain. These tumors usually grow slowly and are most commonly found on one side, although in rare cases, they can occur on both sides. The most typical symptom of the ailment is gradual hearing loss or a feeling of fullness in the affected ear. Various other indications associated with this condition include constant ringing or buzzing in the ear, vertigo, dizziness, facial numbness or weakness, recurring headaches, balance problems, etc. The diagnosis of acoustic neuroma is mainly based on a comprehensive evaluation of clinical features, medical history, and physical examination. A vestibular function test may be conducted to assess the balance and equilibrium of the patient. This investigation can help to determine the extent of the tumor's impact on the vestibular nerve. Furthermore, the healthcare provider will perform contrast magnetic resonance imaging to obtain detailed images of the brain and internal auditory canal and rule out any other health conditions.

The increasing cases of inherited genetic mutations that cause uncontrolled growth of nerve cells, leading to the formation of tumors, are primarily driving the acoustic neuroma market. In addition to this, the rising incidence of high-dose radiation exposure to the head or neck, which can damage the DNA in tissues, is also creating a positive

outlook for the market. Moreover, the inflating application of effective medications, such as non-steroidal anti-inflammatory drugs (NSAIDs), corticosteroids, anticonvulsants, etc., to manage the symptoms of the disease and enhance the quality of life for individuals suffering from the ailment is further bolstering the market growth. Apart from this, the widespread adoption of non-invasive stereotactic radiosurgery techniques that can target and shrink small- to medium-sized cancerous cells in patients who cannot undergo open surgeries is acting as another significant growth-inducing factor. Additionally, the emerging popularity of microsurgery, since it aims to preserve the facial nerve and hearing function while removing the tumor, is expected to drive the acoustic neuroma market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the acoustic neuroma market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for acoustic neuroma and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the acoustic neuroma market in any manner.
