Abstracts

The 7 major acral lentiginous melanoma markets are expected to exhibit a CAGR of 3.3% during 2024-2034.

The acral lentiginous melanoma market has been comprehensively analyzed in IMARC's new report titled "Acral Lentiginous Melanoma Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Acral lentiginous melanoma is a malignant skin cancer that develops from melanocytes, the cells responsible for producing the pigment melanin. It commonly occurs on hairless skin with little to no sun exposure, which includes the palms of the hands, the soles of the feet, and under the nails. The symptom of this ailment often begins as a dark spot, lesion, or patch that may be itchy, tender, or painful. The color of the lesion can vary, ranging from brown to black or even shades of red, blue, or white. If melanoma develops under a nail, it might cause changes in the shape, texture, or thickness of the nail. The diagnosis of this illness typically involves a combination of clinical examination, medical history, and physical tests. The healthcare provider may perform a dermoscopy that uses a special magnifying instrument to evaluate the skin's structures and patterns. This investigation also helps to assess pigmented lesions for signs of malignancy. Various diagnostic procedures, such as X-rays, ultrasounds, CT scans, etc., are utilized to determine the extent of the disease in patients.

The increasing cases of genetic mutations, which can lead to continuous activation of cell signaling pathways, thereby promoting uncontrolled tissue proliferation, are primarily driving the acral lentiginous melanoma market. In addition to this, the expanding geriatric population who are susceptible to a weakened immune system, making it more challenging for the body to control and eliminate cancerous cells, is also

creating a positive outlook for the market. Moreover, the widespread adoption of radiation therapy, owing to its several benefits, such as local tumor eradication, minimal invasiveness, reduced risk of recurrence, etc., is further bolstering the market growth. Apart from this, the inflating application of immunotherapy, since it works by leveraging the body's own immune system to locate and disrupt cancerous cells, thereby boosting long-term survival, is acting as another significant growth-inducing factor. Additionally, the emerging popularity of Mohs micrographic surgery, which involves the precise removal of layers of tissue and real-time examination under a microscope to ensure that all abnormal cells are removed while sparing healthy tissue, is expected to drive the acral lentiginous melanoma market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the acral lentiginous melanoma market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for acral lentiginous melanoma and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the acral lentiginous melanoma market in any manner.
