Abstracts

The 7 major adenoma markets are expected to exhibit a CAGR of 3.84% during 2024-2034.

The adenoma market has been comprehensively analyzed in IMARC's new report titled "Adenoma Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". An adenoma is a type of benign tumor that can develop in various organs and tissues of the body. Unlike malignant tumors (cancer), adenomas are not capable of invading nearby tissues or spreading to other parts of the body. Instead, they grow slowly and remain confined to the site of origin. They may often manifest without any specific symptoms, remaining asymptomatic for extended periods. However, when indications do occur, they can be quite variable depending on the adenoma's location, size, and whether it is hormonally active or not. Some of the common symptoms associated with adenomas are pain or discomfort at the tumor site, changes in bowel habits or rectal bleeding in the case of colorectal adenomas, unexplained weight loss or gain, fatigue, a sense of fullness in the affected area, etc. The diagnosis of the condition involves a comprehensive approach that includes medical history evaluation, physical examination, and various diagnostic tests. Numerous imaging studies, such as computed tomography (CT), magnetic resonance imaging (MRI), endoscopy, ultrasound, etc., are used to visualize the adenoma and determine its size and location. Besides this, a tissue biopsy and histopathological examination are crucial for confirming the adenoma's benign nature and ruling out malignancy.

The increasing prevalence of mutations in specific genes that regulate cell growth and division is primarily driving the adenoma market. In addition to this, the rising incidences

of numerous associated risk factors, including hormonal imbalances, advancing age, chronic inflammatory conditions like inflammatory bowel disease (IBD), exposure to radiation, consumption of diets high in red and processed meats, etc., are also creating a positive outlook for the market. Moreover, the widespread adoption of dopamine agonists, such as bromocriptine and cabergoline, to treat prolactin-secreting adenomas, thereby normalizing prolactin levels and alleviating related symptoms, is further bolstering the market growth. Apart from this, the inflating application of stereotactic radiosurgery, which delivers a focused and high dose of radiation to a specific target while minimizing radiation exposure to surrounding healthy tissues, is acting as another significant growth-inducing factor. Additionally, the emerging popularity of liquid chromatography-mass spectrometry (LC-MS), since it aids in differentiating adenomas from normal tissue and provides insights into the metabolic pathways involved in disease development, is expected to drive the adenoma market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the adenoma market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for adenoma and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the adenoma market in any manner.
