### Market Overview:

The global aircraft synthetic vision system market size reached US\$ 458.4 Million in 2022. Looking forward, IMARC Group expects the market to reach US\$ 590.2 Million by 2028, exhibiting a growth rate (CAGR) of 3.6% during 2023-2028.

An aircraft Synthetic Vision System (SVS) is a computer-facilitated reality-based mechanism that uses 3D technology to guide pilots while flying. It presents a computer-generated view of the external environment with a database of relevant information about the terrain, flight plan information and runways. It enhances the situational awareness of the pilot in low-visibility conditions through moving maps, artificial vision and route planning hardware and software. It also assists in reducing the chances of accidents caused by loss of control, runway incursion and incidences of Controlled Flight into Terrain (CFIT).

The increasing occurrence of CFIT incidences is the key factor driving the growth of the market. The CFIT is an event in which the aircraft, under pilot's control, accidentally flows into water, mountain, ground or any other obstacle. By using aircraft SVS, the pilot becomes aware of the potential dangers, which enables timely alterations of the route. Furthermore, constant safety improvements in commercial and other types of aviation aircraft are significantly increasing the product demand. With the increasing air traffic, there is a growing need for highly efficient flight safety mechanisms. Additionally, the introduction of Unmanned Aerial Vehicles (UAV) has enhanced the utilization of aircraft SVS as they require accurate projections for correct navigation even under challenging environmental conditions. Moreover, factors such as increasing construction of airports

in emerging nations along with the implementation of stringent government policies regarding passenger safety are further expected to catalyze the market growth in the coming years.
