Abstracts

The 7 major astrocytoma markets are expected to exhibit a CAGR of 4.4% during 2024-2034.

The astrocytoma market has been comprehensively analyzed in IMARC's new report titled "Astrocytoma Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Astrocytoma refers to a type of brain tumor that originates from astrocytes, which are a form of glial cell present in the central nervous system. Glial cells provide support and nourishment to neurons and play various roles in maintaining the normal functioning of the brain. Some of the common symptoms associated with the ailment include persistent headaches, seizures, changes in cognitive function, personality or behavior alterations, weakness or numbness in limbs, difficulty with balance and coordination, vision or hearing problems, speech difficulties, etc. The diagnosis of astrocytoma involves a comprehensive evaluation by medical professionals. It typically includes a combination of imaging studies, such as magnetic resonance imaging (MRI) and computed tomography (CT) scans, which help in visualizing the brain and identifying the presence of a tumor. In some cases, a biopsy is necessary to obtain a sample of the tumor tissue for microscopic examination to determine the tumor type and grade. Various other diagnostic tests, including neurological studies and cognitive assessments, may also be conducted to evaluate the patient's overall brain function and identify any specific deficits or abnormalities associated with the tumor.

The escalating incidence of genetic mutations that lead to alterations in cellular metabolism and contribute to tumor development and progression is primarily driving the astrocytoma market. In addition to this, the rising cases of exposure to high levels of

ionizing radiation, such as radiation therapy for other medical conditions or occupational exposure in certain industries, which cause damage at the cellular level, are also creating a positive outlook for the market. Moreover, the widespread adoption of proton therapy that delivers higher doses of radiation to the tumor while minimizing damage to the surrounding healthy tissues is further bolstering the market growth. Apart from this, the inflating application of targeted therapy to selectively inhibit specific molecules or signaling pathways involved in tumor growth and progression is also acting as another significant growth-inducing factor. Additionally, the ongoing advancements in surgical techniques, such as the introduction of awake craniotomy, intraoperative MRI, fluorescence-guided surgery, neuronavigation systems, etc., which aid surgeons in achieving maximal tumor removal and preserving neurological function, are expected to drive the astrocytoma market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the astrocytoma market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for astrocytoma and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the astrocytoma market in any manner.
