## **Abstracts**

The 7 major Burkitt lymphoma markets reached a value of US\$ 996.4 Million in 2023. Looking forward, IMARC Group expects the 7MM to reach US\$ 2,627.8 Million by 2034, exhibiting a growth rate (CAGR) of 9.22% during 2024-2034.

The Burkitt lymphoma market has been comprehensively analyzed in IMARC's new report titled "Burkitt Lymphoma Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Burkitt lymphoma refers to a type of non-Hodgkin lymphoma that is characterized by rapidly growing cancerous cells in the lymphatic system. Some of the common symptoms include swollen lymph nodes in the neck, armpit, or groin; fever; night sweats; weight loss; fatigue; abdominal pain or swelling, etc. In many cases, the cancer can affect other organs like the central nervous system or gastrointestinal tract, leading to additional symptoms, such as anemia, neurological problems, digestive issues, etc. The diagnosis of Burkitt lymphoma typically involves a combination of imaging procedures, blood tests, and a biopsy of an affected lymph node or other tissue. Various imaging studies, including CT scans and MRIs, can help identify the location and extent of the cancer, while blood tests may reveal abnormalities like anemia or elevated levels of lactate dehydrogenase (LDH). Additional tests, such as a bone marrow biopsy or lumbar puncture to look for cancer cells in the central nervous system, may be done to determine the subtype of Burkitt lymphoma and assess the extent of the disease.

The increasing incidences of genetic translocation, in which the MYC gene becomes overactive, thereby leading to uncontrolled cell growth and development of cancer, are primarily driving the Burkitt lymphoma market. In addition to this, the escalating utilization of stem cell transplantation in high-risk cases to help restore the immune

system and prevent cancer recurrence, is further bolstering the market growth. Moreover, the widespread adoption of prophylactic CNS therapy, such as intrathecal chemotherapy or radiation therapy to the brain and spinal cord, for preventing or delaying CNS involvement is also creating a positive outlook for the Burkitt lymphoma market. Additionally, numerous key players are making extensive investments in developing reduced-intensity regimens that can achieve favorable outcomes with fewer side effects. This, in turn, is acting as another significant growth-inducing factor. Furthermore, the emerging popularity of molecular imaging techniques, such as positron emission tomography (PET) scans, since they can identify areas of disease that are not visible on conventional imaging, is expected to drive the Burkitt lymphoma market in the coming years.

IMARC Group's new report provides an exhaustive analysis of the Burkitt lymphoma market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for Burkitt lymphoma and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the Burkitt lymphoma market in any manner.
