Abstracts

The global calcium stearate market size reached US\$ 1.10 Billion in 2023. Looking forward, IMARC Group expects the market to reach US\$ 1.60 Billion by 2032, exhibiting a growth rate (CAGR) of 4.1% during 2024-2032.

Calcium stearate (C₃₆H₇₀O₄.Ca) is a carboxylate of calcium that is produced by the reaction of stearic acid and calcium oxide. Also known as calcium octadecanoic acid, it has a high melting point of around 356°F and is accessible in both solid and liquid forms. As calcium stearate is relatively easy and affordable to manufacture with low toxicity, it is used in a number of industries across the globe.

Calcium stearate is employed in the rubber processing industry as an anti-caking and scavenging agent to prevent coagulation of uncured rubber and release the final product from molds. In line with this, the rising demand for rubber in the automobile industry is impelling the growth of the market. It is also used for improving the sheen and extending the life of paper products in the pulp and paper industry. Moreover, as calcium stearate is considered fit for human consumption, it is used in the food industry for producing spices, candies and other confectionary items. Similarly, in the pharmaceutical industry, it is incorporated into various supplements and oral drug formulations. Additionally, liquid calcium stearate is utilized in the cement industry to prevent secondary efflorescence and minimize the loss of solvated salts, owing to the

continuous exposure of adhesive to the air. Furthermore, the thriving construction industry, driven by the increasing infrastructural activities and rising residential and commercial construction, is anticipated to increase the demand for calcium stearate in the upcoming years.
