# **Abstracts**

Ceramic tiles are thin slabs primarily made-up of earthy minerals and are generally used as coverings for floors and walls. Unlike other flooring options like marble, concrete, carpet, rugs, resilient and non-resilient materials; ceramic tiles are more durable, recyclable, highly resistive to frost, water and thermal shocks, and even easy to install, clean and repair. They also provide substantial resistance to high temperatures, harsh environments and can withstand when exposed to caustic or acidic chemicals. Due to their availability in various shapes, sizes, textures, colors and glazing options, they are increasingly being used in residential, commercial as well as industrial buildings. The lightweight, ultra-thin, anti-slip tiles with anti-bacterial properties are becoming an excellent choice for hotels, hospitals, laboratories and pharmaceutical industries where hygiene is of prime importance. Today, they have captured a significant market share in the global flooring materials market. Some of the key factors that are currently driving this market include- rising disposable incomes, increasing urbanization and industrialization rates, growth in the real estate sector, technological advancements, increasing personalization/customization trends, etc.
