Abstracts

The 7 major Cholangiocarcinoma markets reached a value of US\$ 952.5 Million in 2023. Looking forward, IMARC Group expects the 7MM to reach US\$ 2,590.7 Million by 2034, exhibiting a growth rate (CAGR) of 9.5% during 2024-2034.

Cholangiocarcinoma market is currently driven by factors such as a rising geriatric population, increasing number of patients with liver disease, a large smoking population, growing number of patients with diabetes, and rising safety and efficacy of current and emerging therapies, etc. Furthermore, the introduction of technologically advanced diagnostics that assist in monitoring tumour progression, assessing therapeutic response and clinical prognosis, and detecting recurrent tumours is further creating a positive outlook for the market.

Cholangiocarcinoma is a type of cancer involving the mutation of epithelial cells in the bile ducts. Some of the common factors responsible for the disease development include prolonged inflammation in the liver, biliary stones, abnormalities in the bile duct such as cysts, infection caused due to liver flukes parasite, and exposure to harmful chemicals and toxins. It occurs mostly in people over 65 years, though it may occur at any age. Cholangiocarcinoma is also slightly more common in men compared to women. The indication usually does not cause symptoms till it reaches an advanced stage and has spread to other organs and tissues. Few patients may, however, experience early symptoms. These may involve the yellowing of the skin and the whites of the eyes, itchiness of skin, light-colored stool, pain/bloating in the stomach, nausea and vomiting, loss of appetite/unexplained weight loss, fever, and fatigue.
