Abstracts

The 7 major chronic bronchitis markets are expected to exhibit a CAGR of 2.69% during 2024-2034.

The chronic bronchitis market has been comprehensively analyzed in IMARC's new report titled "Chronic Bronchitis Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Chronic bronchitis is a long-term respiratory condition characterized by irritation and inflammation of the bronchial tubes, which are the airways that carry air from and to the lungs. The main symptom of this disease is a persistent cough that produces sputum (a thick, sticky mucus) for at least three months in two consecutive years. Numerous other common indications include a sensation of breathlessness, wheezing, chest tightness, fatigue, frequent respiratory infections, a bluish discoloration of the lips and fingertips, etc. The diagnosis of chronic bronchitis is mainly based on the patient's clinical features, medical history, and physical examination. An arterial blood gas test, which evaluates the oxygen and carbon dioxide levels in the blood and helps to assess lung functionality, is also utilized in individuals suffering from this condition. Furthermore, a chest X-ray or CT scan is recommended to detect signs of inflammation or infection that can rule out other possible causes of the symptoms. The healthcare provider may additionally conduct several studies, such as sputum culture, spirometry, allergy tests, etc., to confirm a diagnosis among patients.

The increasing cases of long-term exposure to irritants, including cigarette smoke, air pollution, occupational hazards, etc., that can inflame the lining of the bronchial tubes are primarily driving the chronic bronchitis market. In addition to this, the growing geriatric population, who are susceptible to scarring of the airways on account of age-

related decline in lung functioning, is also creating a positive outlook for the market. Moreover, the widespread adoption of bronchodilators, like albuterol, salmeterol, tiotropium, etc., which help to relax and widen the nasal passage, thereby improving breathing problems in patients, is further bolstering the market growth. Apart from this, the inflating application of airway clearance techniques, such as chest percussion and postural drainage, owing to their several benefits, including enhanced sputum clearance, increased exercise tolerance, and reduced risk of respiratory infections, is acting as another significant growth-inducing factor. Additionally, the emerging popularity of inhaled corticosteroid therapy, since it involves the delivery of anti-inflammatory drugs directly to the airways to provide effective local treatment while minimizing systemic exposure, is expected to drive the chronic bronchitis market during the forecast period.

IMARC Group's new report provides an exhaustive analysis of the chronic bronchitis market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for chronic bronchitis and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the chronic bronchitis market in any manner.
