Abstracts

The global colposcopes market size reached US\$ 594.0 Million in 2022. Looking forward, IMARC Group expects the market to reach US\$ 841.2 Million by 2028, exhibiting a growth rate (CAGR) of 6.0% during 2022-2028.

Colposcopes are binocular instruments used to examine the cervix and other parts of a woman's lower genital tract under magnified stereoscopic vision. They usually have fans, lamps, stands, eyepieces, green filters, magnification changers, focus adjustment knobs, and fiber-optic light cables. Nowadays, several colposcopes are available with cameras attached to the optics using a beam splitter. These colposcopes can present images on the monitor of a light-emitting diode (LED) television or a computer screen, which can also be recorded and stored for future references.

Colposcopes Market Trends:

The growing consumption of tobacco products, the rising prevalence of human immunodeficiency virus (HIV), and the long-term use of oral contraceptives are significant factors increasing the risk of developing cervical cancer among women. This represents one of the key factors driving the need for colposcopes for early diagnosis of cancer, genital warts, and noncancerous growths called polyps. The market is also influenced by improving diagnostic modalities and the growing awareness about the benefits of early diagnosis. Moreover, health agencies of numerous countries are implementing various programs and strategies to deal with the increasing cases of cervical cancer. For instance, Public Health England (PHE) launched a national multimedia campaign in 2019 to encourage cervical screening among women of all ages. In addition, advances in cervical cancer treatment, such as surgery, chemotherapy, and radiation therapy, are contributing to the growth of the market. Besides this, as colposcopy is a painless, cost-efficient, and non-invasive procedure, its demand is escalating worldwide. Furthermore, new technologies, such as polarimetric imaging, optical coherence tomography, and fluorescence, electrical impedance, and

diffuse reflectance spectroscopy, are widely being used to improve the diagnostic accuracy of colposcopy.
