Abstracts

The global concrete superplasticizer market size reached US\$ 4.8 Billion in 2023. Looking forward, IMARC Group expects the market to reach US\$ 7.1 Billion by 2032, exhibiting a growth rate (CAGR) of 4.2% during 2024-2032.

Superplasticizers are a category of polymers which are used to enhance the suspension flow efficiency by reducing the accumulation of particulate matter. Their major application is in admixtures which are used with concrete as strength boosters. Currently, there are different classes of superplasticizers available in the market including sulfonated naphthalene formaldehydes (SNF), sulfonated melamine formaldehydes (SMF), modified lignosulfonates (MLS), polycarboxylic acids (PC), etc. Each category of superplasticizer is defined by individual properties and uses. Their demands also differ on the basis of their cost, placement and product efficiency.

A number of factors are currently driving the global demand of concrete superplasticizers. Plasticizers help in reducing the water cement ratio and improve the performance of the concrete mixture. They can also provide other advantages such as increase the compressive strength, eliminate fine cracks, reduce adsorption, provide better surface texture, etc.

The demand of concrete superplasticizers has a direct correlation with the performance of the global construction Industry. We expect the global construction industry to exhibit stable growth of around 3%-5% over the next five years catalysed by developed

economies recovering from the recent economic downturn and emerging economies continuing to industrialize. The United States, China and India are expected to represent the biggest growth drivers of the construction sector in the coming years. The strong outlook of the global construction industry is expected to create a positive impact on the demand of concrete superplasticizers.
