## **Abstracts**

The 7 major dermatomycosis markets are expected to exhibit a CAGR of 3.47% during 2024-2034.

The dermatomycosis market has been comprehensively analyzed in IMARC's new report titled "Dermatomycosis Market: Epidemiology, Industry Trends, Share, Size, Growth, Opportunity, and Forecast 2024-2034". Dermatomycosis, also known as fungal skin infections, is a group of skin conditions caused by fungal organisms. These infections can affect various parts of the body, including the skin, hair, nails, etc. Some common symptoms associated with the disease are redness, itching, scaling, flaking of the skin, etc. In many cases, blisters or pus-filled lesions may develop. The affected area may also become swollen and tender to the touch. Fungal infections of the nails can cause thickening, discoloration, and crumbling of the nail. Additionally, the skin may crack and bleed in severe cases, leading to secondary bacterial infections. Some types of dermatomycosis, such as ringworm, can be accompanied by hair loss in the disease-affected area. The diagnosis of dermatomycosis is typically made based on a combination of the patient's medical history, physical exam, and laboratory tests. The doctor will examine the affected skin, hair, or nails during the physical exam and may take a sample for laboratory testing. A microscopic examination of the sample is used to identify the fungus causing the infection, and cultures are utilized to confirm the diagnosis. Sometimes, a skin biopsy may be necessary to rule out other conditions.

The rising incidence of skin infections caused by various fungal species, including dermatophytes, yeasts, molds, etc., is primarily driving the dermatomycosis market. In addition to this, the increasing prevalence of associated risk factors that contribute to the development of the disease, such as warm and humid environments, poor hygiene,

compromised immune systems, close contact with infected individuals or animals, etc., is further bolstering the market growth. Moreover, the widespread adoption of oral antifungal drugs, including terbinafine, fluconazole, itraconazole, etc., for treating more severe cases of dermatomycosis is also creating a positive outlook for the market. These medications target the fungi inside the body and can effectively treat infections affecting the nails or scalp. Additionally, several key players are making extensive investments in R&D activities to establish a deeper understanding of the molecular mechanisms of fungal infections and introduce drugs that target specific pathways. This, in turn, is acting as a significant growth-inducing factor. Furthermore, the emerging popularity of photodynamic therapy (PDT), which uses a combination of a photosensitizing agent and light to selectively destroy targeted fungal cells, as a more convenient and less traumatic option for patients, is expected to drive the dermatomycosis market in the coming years.

IMARC Group's new report provides an exhaustive analysis of the dermatomycosis market in the United States, EU5 (Germany, Spain, Italy, France, and United Kingdom) and Japan. This includes treatment practices, in-market, and pipeline drugs, share of individual therapies, market performance across the seven major markets, market performance of key companies and their drugs, etc. The report also provides the current and future patient pool across the seven major markets. According to the report the United States has the largest patient pool for dermatomycosis and also represents the largest market for its treatment. Furthermore, the current treatment practice/algorithm, market drivers, challenges, opportunities, reimbursement scenario and unmet medical needs, etc. have also been provided in the report. This report is a must-read for manufacturers, investors, business strategists, researchers, consultants, and all those who have any kind of stake or are planning to foray into the dermatomycosis market in any manner.
