Abstracts

The 7 major Diffuse Large B-cell Lymphoma (DLBCL) markets reached a value of US\$ 3,907.8 Million in 2023. Looking forward, IMARC Group expects the 7MM to reach US\$ 5,257.7 Million by 2034, exhibiting a growth rate (CAGR) of 2.7% during 2024-2034.

Diffuse Large B-cell Lymphoma (DLBCL) market is currently driven by factors such as a rising patient pool, improving diagnosis and drug treatment rates, an increase in the geriatric population and rising safety and efficacy of current and emerging therapies, etc. Diffuse Large B-Cell Lymphoma, a form of non-Hodgkin lymphoma, represents the most common blood cancer. Lymphomas develop when immune cells, known as B lymphocytes, grow and multiply in an uncontrolled way. DLBCL develops mostly in adults and is a rapidly-growing (aggressive) lymphoma. It can begin in the lymph nodes or outside of the lymphatic system in the gastrointestinal tract, testes, thyroid, skin, breast, bone, or brain. Usually, the first symptoms of DLBCL is a painless swelling in the neck, armpit, abdomen, or groin caused by enlarged lymph nodes. This swelling can also be painful for some people. Other symptoms of DLBCL may include night sweats, unexplained fevers, and a loss in weight. DLBCL can occur at any age, however, it is generally rare in children and is more common in older people. Most people diagnosed with DLBCL are usually 60 or over. Furthermore, DLBCL affects slightly more males than females. Other risk factors include family history, certain infections, weakened immune system, obesity, exposure to certain chemicals, etc.
